

## Instructions for installation and use:

1. Unzip yoDraw.zip.
2. In the 'company' folder there is a sample logo and a 'company\_config.php' file. You can put your own logo image in that folder. Keep the image size 89px high for best display.
3. Open the company\_config.php file in a text editor and change these three lines in bold - keeping the quotes around your company information :  

```
define ('PDF_COMPANY_TITLE', 'Company title');  
define ('PDF_COMPANY_CONTACT', 'Company address, company phone');  
define ('PDF_COMPANY_LOGO', 'logo.png'); // the filename of your logo
```
4. Upload all of the folder and files to your web server.
5. You'll see a folder named 'drawings'. Change the permissions on that folder to be writeable (777 for many servers). This is where the drawings are stored.
6. Go to <http://www.yourserver.com/yoDraw/yoDraw.html> to start drawing!

To Draw here are a few notes:

1. Input width and length of building and click 'draw'.
2. Give each building a unique number (use invoice number).
3. The date is automatically generated based on today's date. It can be edited as can most text boxes.
4. When an object touches a wall, it will want to draw in the dimensions. That's why the lofts and workbench are drawn slightly smaller.
5. Delete objects by clicking on them and pressing 'delete' on your keyboard
6. Orient the pieces so that the 'handle' of the door/window is facing outside the building. The program uses the orientation of the piece to calculate the dimensions on each wall.
7. It may be easier to select objects when the grid is hidden.
8. To the right of the 'show grid' button - 'Save', draw a line that can be moved and stretched, 'M' will put a text box that can be moved and edited, and a basic 'undo' button.
9. To save...
  - a. Click the save button then 'open'. This opens a pdf file in new browser window.
  - b. Save as PDF to your computer or print.

See Screenshot below.
